

1 Create a Flask project that accepts form input and shows the data on another webpage.

Aim

To create a Flask web application where a user submits data through a form (e.g., name and email), and the submitted data is displayed on a separate webpage.

Algorithm

1. Import Flask and required modules.
2. Create a route that displays a form with input fields.
3. On form submission (), capture the data.
4. Redirect to another route that displays the submitted data.
5. Run the Flask app.

CODE

```
from flask import Flask, request, redirect, url_for
```

```
app = Flask(__name__)
```

```
# Route for form input
```

```
@app.route('/', methods=['GET', 'POST'])
```

```
def index():
```

```
    if request.method == 'POST':
```

```
        name = request.form['name']
```

```
        email = request.form['email']
```

```
        # Redirect to result page with data
```

```
        return redirect(url_for('result', name=name, email=email))
```

```
    return ""
```

```
    <h2>User Form</h2>
```

```

<form method="POST">
    Name: <input type="text" name="name"><br><br>
    Email: <input type="text" name="email"><br><br>
    <input type="submit" value="Submit">
</form>
'''

# Route to display submitted data
@app.route('/result')
def result():
    name = request.args.get('name')
    email = request.args.get('email')
    return f'''
        <h2>Submitted Data</h2>
        <p>Name: {name}</p>
        <p>Email: {email}</p>
    '''

if __name__ == '__main__':
    app.run(debug=True)

```

OUTPUT

- ❑ Open browser at <http://127.0.0.1:5000/>.
 1. Fill form:

Name: Yogin

Email: yogin@example.com
- ❑ After clicking **Submit**, redirected to /result:

Submitted Data

Name: Yogin

Email: yogin@example.com

Conclusion

- This Flask project demonstrates **form handling** and **data display** on another webpage.
- It uses `request.form` to capture input and `redirect + url_for` to pass data to the result page.
- This is a foundation for building more complex applications like **registration systems** or **feedback forms**.

2 Write a Flask program to redirect from one page to another.

Aim

To write a Flask application that shows how to redirect users from one route (page) to another using `and` .

Algorithm

1. Import Flask, , and .
2. Create a route that displays a welcome message.
3. Create another route that redirects the user to .
4. Run the Flask app and test redirection.

CODE

```
from flask import Flask, redirect, url_for
```

```
app = Flask(__name__)
```

```
# Route 1: Home page
```

```
@app.route('/home')
```

```
def home():
```

```
return "<h2>Welcome to the Home Page!</h2>"
```

```
# Route 2: Redirect page
```

```
@app.route('/redirect')
```

```
def go_home():
```

```
    # Redirect user to the home page
```

```
    return redirect(url_for('home'))
```

```
if __name__ == '__main__':
```

```
    app.run(debug=True)
```

OUTPUT

1. Run the program:
2. `python app.py`
3. ☐ Open browser at `http://127.0.0.1:5000/redirect`.
4. You will be **redirected automatically** to:
5. <http://127.0.0.1:5000/home>
6.
 - Displayed message:
7. Welcome to the Home Page!

Conclusion

- The program demonstrates **redirection in Flask** using `redirect()` and `url_for()`.
- Visiting `/redirect` sends the user to `/home`.
- This technique is useful for **navigation, login systems, and workflow control** in web applications.
